

Screening and Interventions for Overweight and Obesity in Adults: Systematic Evidence Review Number 21

By U. S. Department of Health and Human Services

CreateSpace Independent Publishing Platform. Paperback. Book Condition: New. This item is printed on demand. Paperback. 130 pages. Dimensions: 11.0in. x 8.5in. x 0.3in. Obesity, a condition characterized by excess body fat, carries significant health implications for both chronic disease and mortality. In the setting of escalating prevalence, the importance of obesity as a health problem in the United States is increasingly evident, as emphasized by the Surgeon Generals Call to Action to Prevent and Decrease Overweight and Obesity. Obesity is usually defined in terms of the body mass index (BMI, calculated by dividing kilograms of weight by meters of height squared), which is a measure of weight adjusted for height. Although numerous techniques are available for evaluating body fat, the variables for BMI are easy to measure. BMI has been shown to correlate closely with body fat content in adults and children. Adults with a BMI of 25 to 29.9 are identified as overweight and those with a BMI less than 30 as obese. These cutoffs are based on epidemiologic evidence of discernible, then substantial, increases in mortality. The prevalence of obesity is increasing. Data from the National Center for Health Statistics show that, over the past 40 years, obesity...
